

IN THE SPECIFICATION

On page 1, Please rewrite paragraph 0009 as follows:

[0009] According to another preferred embodiment of the invention, the recombinant proteins are produced using the yeast ~~Pichie~~ Pichia pastoris. While the yeast is easy to culture like E. coli, it is, as a eukaryote, much more suitable for achieving correct folding of the recombinant proteins. It is furthermore able to glycosylate proteins, something which is important for their structural completeness, their solubility and their biological activity. In addition to this, yeast proteins can be secreted through the cell wall, thereby greatly facilitating the separation of the desired products from cellular constituents.
